

We rebuilt our AI system. Here is what actually mattered.

Not more tools. Not more agents. One working flow that stops work getting lost.

The trap is more architecture

More agents. More dashboards. More automation layers.

None of it matters if work still disappears between steps.

A working system does four jobs

- 01 Capture the work
- 02 Route it clearly
- 03 Act in the right place
- 04 Return a receipt

Capture work when it appears

Do not rely on someone remembering to copy it into another tool later.

The first handoff is where visibility starts.

Route it. Then make ownership obvious.

The right person or agent should know what happens next.

If ownership is fuzzy, the workflow is already leaking.

The receipt is part of the work

A finished task should leave proof someone can check.

No receipt means no reliable answer to: **did it actually happen?**

Where does work drop in your business?
